Cloud Fundamentals

Original introductory study example. Read each numbered lesson, then try the local demonstration quiz. No provider affiliation or professional certification is claimed.

Chapter 1: Cloud concepts

1.1 Service models

IaaS, PaaS and SaaS place different operational responsibilities on the customer and provider.

1.2 Shared responsibility

Check the selected service: customer responsibilities do not disappear when a workload moves to the cloud.

Chapter 2: Build a service

2.1 Compute and storage

Compute runs a workload. Storage retains data. Select resources to suit an example application requirement.

2.2 Identity and access

Use named identities and least privilege. Keep secrets out of source code.

Chapter 3: Operate responsibly

3.1 Monitor a workload

Track service health and investigate useful alerts. Define a recovery objective with the service owner.

3.2 Control cost

Tag resources, review usage and set budget alerts before experimenting with paid services.

Practice checkpoint

Explain the concept in your own words, describe an approved example, and record what you still need to learn. The demonstration quiz includes single-answer, multiple-answer, fill-in-the-blank and matching questions.
