Hackathon project sidebar and
SDC-Hackathon-main folder
Lee
I have tried it out, when I press the News button at the sidebar, it will jump to the SDG impact page. I need the News page to be an independent page that push news to the users. Help me fix this and let me know what file/folder I need to replace
22 hours ago
Ran 1 command
Found it: frontend/next.config.ts has an old redirect that sends /app/news to the SDG Reading tab before the News page can load.
Ran 1 command and used 1 tool
News page fix (next.config.ts)
File
I've fixed it. Your project already had an old redirect in frontend/next.config.ts that sent /app/news to the SDG impact page's Reading tab. The redirect runs before the page loads, so the News page I added never got a chance to show. Your screenshot matches: the address is /app/news , but you land on SDG impact → Reading.
What changed (one file): frontend/next.config.ts
Removed the /app/news → SDG Reading

Help me check and enhance my pitching script
Free 2 minutes ago
I need to read the uploaded document skills to enhance the deliverable. First, I should
I'll read the script, then tighten the pitch for clarity, persuasiveness, and spoken delivery while keeping your core message intact.
Ran 1 command, read 1 file, and used 1 tool
The script has a strong student-focused hook and a clear product journey, but the demo section currently reads like a feature list and a few AI claims sound more certain than the evidence in the script supports. I'm reshaping it into a smoother spoken pitch, keeping the existing features and adding a short presenter checklist for claims judges may challenge.
Ran 2 commands
I've rewritten it as a presenter-ready script with clear on-screen cues. I also softened claims about job forecasts and SDG impact so they're credible in a judging Q&A, and I'm checking the finished Word document now.

experience paragraph are not extracted.
The scenario does not change the career-match score. In this uploaded version, forecast() returns qualitative labels, not a numeric score, and its horizon does not change those labels.
So, 80/100 means the CV scored 80 under this particular rubric—not an 80% chance of getting hired or passing an employer's ATS.

why gemini is not running
1 minute ago
I'll check the attached logs to see where the Gemini request fails and why the app falls back to the rule-based score.
Ran 2 commands
Gemini is running—the app is rejecting its response afterward. Both attempts received HTTP 200, but Pydantic failed when validating the returned data against AICVEvaluation. AI is enabled and CV consent is enabled, so neither setting is blocking the request.
What is failing
The data being validated contains score fields, but is missing five required fields:
impact_feedback
role_relevance_feedback
technical_depth_feedback
clarity_feedback
suggestions
Both attempts fail for the same missing fields. This indicates a mismatch between the data produced by your Gemini response-handling code and what your Pydantic schema requires—not an API connection failure. The logs alone don't establish whether Gemini omitted those fields or your parsing code dropped them.
How to fix it
Make the Gemini output and AICVEvaluation agree:
1. Include every required field and its expected type in the requested response format.
2. Prefer Gemini structured output with a schema matching AICVEvaluation.
3. Check that your parsing code preserves the feedback fields and suggestions before validation.
Simply retrying the unchanged request isn't resolving the mismatch. Also, your /cv/analyze endpoint returning 200 OK only means the endpoint completed—it does not prove the AI review succeeded.
Can you attach the Gemini request/parsing function and the AICVEvaluation definition so I can pinpoint the exact change?

I think I need to answer directly and mention that the source is in the attached snapshot
I'll verify the configuration defaults and fallback path in the attached source so I can distinguish the code's intended behavior from what would require checking the live deployment settings.
Ran 2 commands
Because the project is taking its keyword fallback path. In that path, the code assigns 150 XP to every project, regardless of how good or nonsensical the description is; the text only affects which SDGs receive the XP split. In the attached source, SDG AI is disabled by default.
For AI assessment to run, SDG_AI_ENABLED must be enabled and GEMINI_API_KEY and a valid GEMINI_MODEL must be configured. If Gemini fails or returns an unusable response, the code silently falls back to 150 XP as well. A successful AI assessment can award 100, 150, or 200 XP based on the described project's scope.
You can tell which path an entry used by checking its assessed_by value: keywords means the fixed 150-XP fallback; ai means Gemini assessed it. The screen labels AI-assessed entries. I can confirm the attached source's defaults, but not the settings of a live deployment from this ZIP alone.
